

1. **Question 1** What tag is used to create a form? Name its attributes

**Answer 1** A form input element is used and must have two attributes: action and method.

**Question 2** Get method is the most secure way of submitting data. Yes or No? State reason.

**Answer 2** Yes, get method is most secure because it sends the data in an encrypted package.

**Question 3** How are label and input connected?

**Answer 3** An input element must be accompanied by a label.

**Question 4** Does placeholder get submitted to the server

**Answer 4** No, as soon as the user starts typing the text disappears.

**Question 5** How would you make an input required

**Answer 5** The required attribute is used to make this field input required and the brower won't let the user submit without adding this value.

**Question 6** How would you make an input read-only?

**Answer 6** By using the readonly attribute, it does not allow the user to change the field.

**Question 7** What tag is used to create groups in a select list?

**Answer 7** optgroup or option group is used to create groups in a select element.

**Question 8** What is the difference between Radio Buttons and Check-boxes?

**Answer 8** Radio are singular value checkboxes, which means the user can select only one value.

**Question 9** What tag is used to create summary input? Give example.

**Answer 9** Using textarea with a closeing tag, the name attribute and id attribute you can provide more than one line of text area for the user. The user can also specify line breaks, while you can specify the placeholder. An example would be:

This is the text area for a summary

**Question 10** The form is of no use, without which element?

**Answer 10** Button type "submit" creates a button that submits the form and HTML% elements get automatically validated by the brower. Without this, the form is useless.
